GAGE JORDAN BASELINE SAMPLE OVERVIEW AND DATA USE MANUAL

Erin Oakley, Sarah Baird, Nicola Jones, Agnieszka
Małachowska, and Anas Al Masri

October 2021

Acknowledgements

The authors wish to thank the GAGE Jordan quantitative research team based at Mindset, especially Rana Samara, Nada Shannak, Mohammad Qaryouti, and Majd Haddad.

We wish to gratefully acknowledge the continuous support of UNICEF Jordan staff, including their participation in the GAGE baseline validation workshops in April 2019, thoughtful reflections and feedback to the research design and findings, and support in disseminating GAGE findings to key stakeholders. In particular, we would like to thank Maureen Njoki, Kenan Madi and his team, Hideyuki Tsuruoka, Manuel Rodriguez Pumarol, Jessica Chaix, Robert Jenkins and Ettie Higgins for their ongoing support and dedication to the UNICEF and GAGE partnership. We would also like to thank the Office of the United Nations High Commissioner for Refugees in Jordan (UNHCR) for their feedback to the research design and assistance in accessing research sites in Zaatari and Azraq Camps.

In addition, we would like to sincerely thank Caroline Spencer for her incredible feats of project management, and Anne Solon for her patience and oversight of the data publication process.

Finally, we wish to thank all the adolescents, caregivers, community leaders, service providers and government officials who generously agreed to be part of the study and provided us with rich insights into the lived experiences of adolescent girls and boys in Jordan.

1 Introduction

Gender and Adolescence: Global Evidence (GAGE) is a nine-year (2015-2024) research programme, funded by UK Aid from the UK Department for International Development (DFID), that seeks to combine longitudinal data collection and a mixed-methods approach to understand the lives of adolescents in particularly marginalized regions of the Global South, and to uncover ‘what works’ to support the development of their capabilities over the course of the second decade of life, when many of these individuals will go through key transitions such as finishing their education, starting to work, getting married and starting to have children.

In Jordan, GAGE recruited a sample of 4,101 adolescent girls and boys in two separate cohorts (younger adolescents aged 10–12 years and older adolescents age 15–17 years at baseline). GAGE surveyed the adolescents, as well as their adult female caregivers and, for those enrolled in formal schooling, conducted surveys at their schools. This sample includes Syrian refugees living in refugee camps, informal tented settlements (ITS) and host communities, as well as Palestinian refugees living in refugee camps and host communities, vulnerable Jordanian adolescents living in communities hosting refugees, and a small group of adolescents of other nationalities (Egyptian, Iraqi, and others) living in Jordan. The research sample was recruited during 2018 and 2019. More details on the baseline data collection process, including a description of the household- and individual-level survey instruments and data quality control and cleaning, can be found in the GAGE Jordan Baseline Data Collection Field Manual (2021).

The current document describes the household- and individual-level data that has been made publicly available from the GAGE Jordan data collection activity, which took place during late 2018 and early 2019. In particular, this manual describes the household-level dataset, including a description of identifiers, location variables, key data issues, and how to understand and use the data.

2 GAGE Jordan Sample Overview

2.1 Setting

Situated at the crossroads of the Middle East and North Africa (MENA), Jordan has a long history of hosting the region's refugees. Beginning with Palestine refugees in 1948, followed by Iraqi refugees in the 1990s and, since 2011, accepting hundreds of thousands of Syrians fleeing both drought and civil war, it is estimated that of Jordan's approximately 10 million inhabitants, 1 in 3 is a refugee. Of those, more than 2 million are Palestinian (United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), 2019b), just over 660,000 are Syrian, and nearly 100,000 are from Iraq, Yemen and Sudan (UNHCR, 2019). Additional details on the Jordanian context are available in the GAGE Jordan Baseline Report (Jones et al, 2019).

2.2 Sample

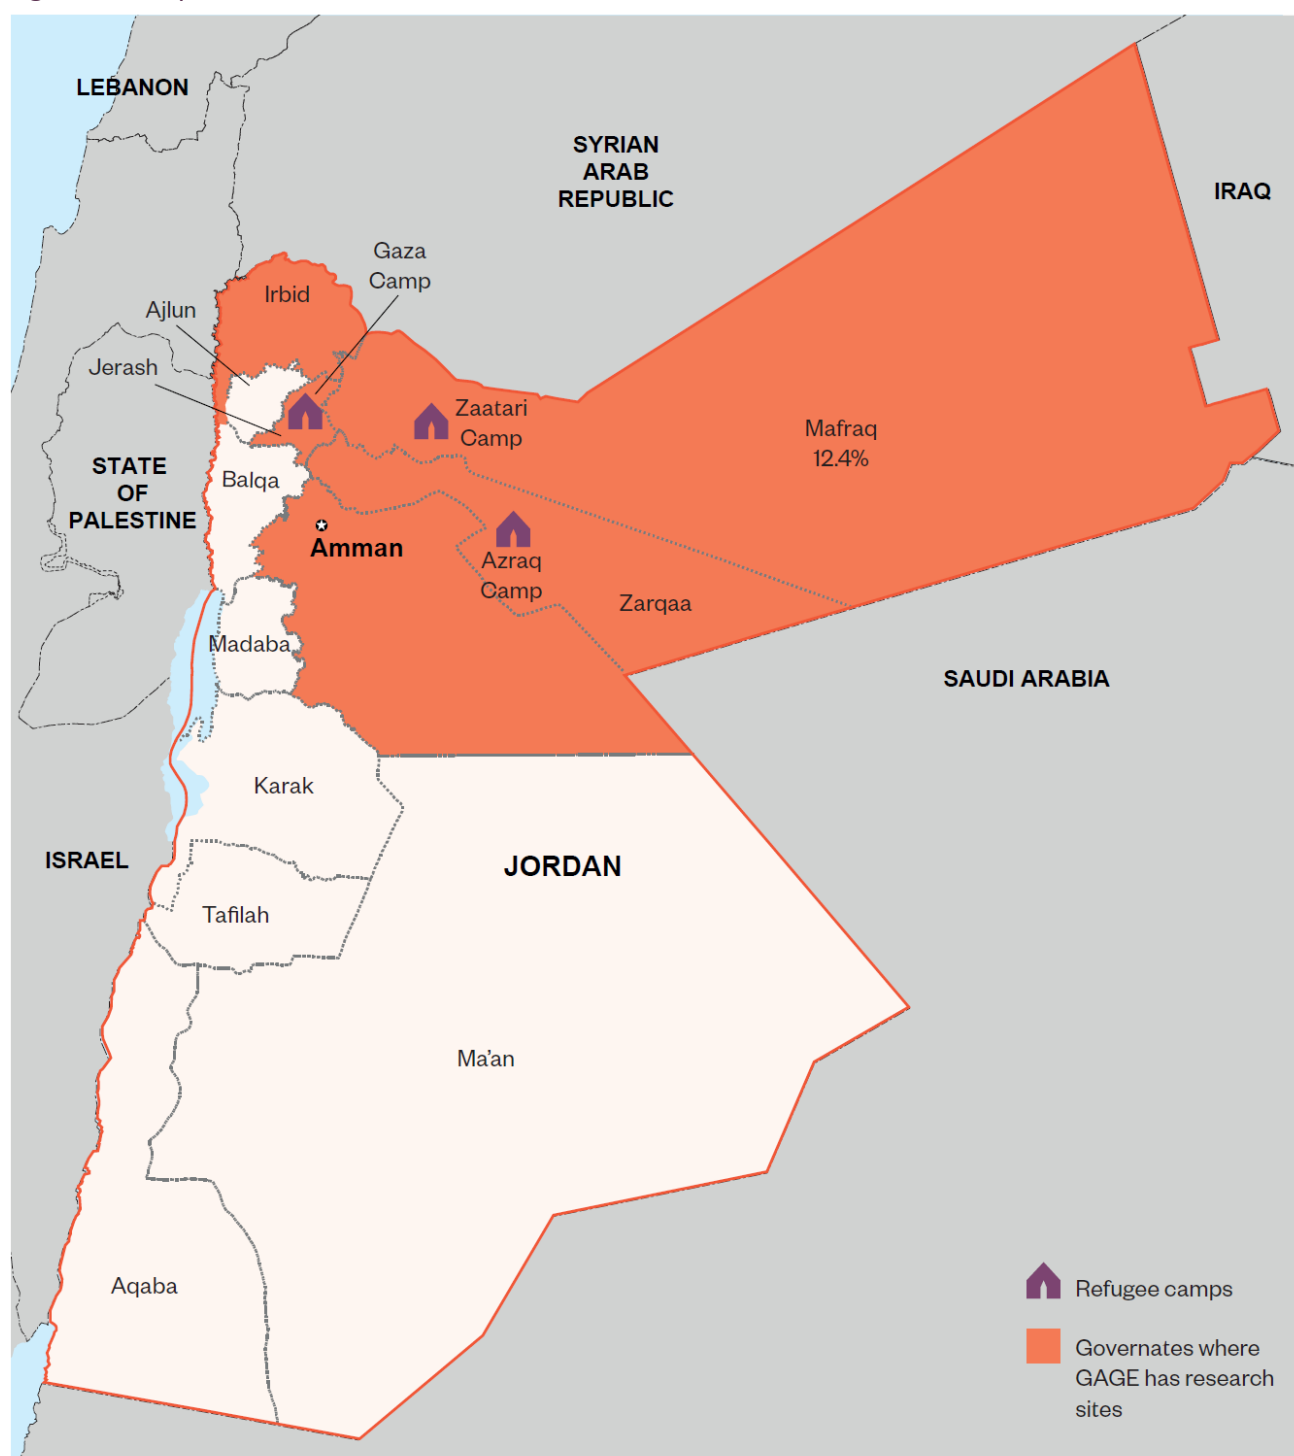

The mixed-methods, longitudinal GAGE study in Jordan focuses on the most vulnerable adolescents in the country, including refugees, vulnerable Jordanians, adolescents with disabilities, those out of school, as well as married girls and adolescent mothers. In addition to documenting the opportunities and challenges faced by these vulnerable adolescents over time, GAGE is partnering with UNICEF Jordan to explore the effects of UNICEF's integrated adolescent and youth programming (Makani) and cash transfer programme (Hajati) on the well-being and empowerment of vulnerable adolescent girls and boys. Our sample focuses on Syrians in host communities, informal tent settlements (ITS), and in Azraq and Zaatari camps, Palestinian refugees without national documentation in Gaza Camp, as well as vulnerable Jordanians. Additional details on GAGE's conceptual framework in the Jordanian context can be found in the GAGE Jordan Overview (GAGE Consortium, 2020).

The GAGE sample is drawn from five governorates in Jordan – Amman, Mafrqa, Irbid, Zarqa and Jerash – where most of the Syrian refugee population live. In order to explore the complexity of adolescent realities in refugee and host communities, we spread our sample across three very different contexts: host communities¹, informal tented settlements (ITS), and United Nations (UN) refugee camps (see map in Figure 1). Recognising that recent attention has been focused on the Syrian population, and that Jordan's Palestinian population is increasingly invisible to development actors, we have also included the ex-Gazan Palestinian population in Jerash refugee camp, which has high rates of child marriage and is particularly disadvantaged economically and socially due to residents lacking national identity documents.

To understand the effects of UNICEF's programming – especially its Makani centres (see Appendix 1) – it was important that our sample included Makani participants and non-participants. For participants, we were able to select adolescents using data from UNICEF's Bayantati (Our Data) database. For non-participants, we undertook a twostep process. In host communities, to minimise differences between the participant and non-participant sample, we selected adolescents whose families were either receiving UNICEF's Hajati cash transfer for vulnerable households, or those who were eligible but due to resource constraints were still on the waiting list (as of mid-2018).

¹ UNHCR (2019) reports that 84% of Syrian refugees live in host communities and 16% live in formal camps

Figure 1: Map of GAGE Research Sites in Jordan

Source: Based on the UNHCR Jordan situational map of Jordan as of 2018 and modified to show GAGE research sites

In the camps, because there is no equivalent cash transfer programme, we relied on the Refugee Assistance Information System (RAIS) of the UN Refugee Agency (UNHCR) and selected adolescents from families with similar vulnerability scores. Within Gaza Camp, specifically, we relied on multiple methods to identify eligible adolescents for the GAGE sample. Palestinian adolescents living in Gaza Camp who also participated in Makani were identified through UNICEF's Bayantati (Our Data) database. To identify additional Gaza Camp residents

for participation, we relied on snowball sampling, purposefully seeking out adolescents who met eligibility criteria for the GAGE study by relying on the referrals of other participants.

Our final quantitative sample consisted of 4,101 adolescents, equally split by sex (girls and boys) and by age cohort (younger adolescents aged 10–12 years, and older adolescents aged 15–17 years). Because sampling was based on household vulnerability, and refugee households are more vulnerable than Jordanian households, our sample is tilted towards refugees (with 15% Jordanians) (see Table 1 and Appendix 2 for details) (Baird et al., 2018). In line with the mandate of the Sustainable Development Goals (SDGs) to ‘leave no one behind’, we also deliberately over-sampled some groups of especially marginalised young people, including those with disabilities and girls who were (or had been) married. For more details on the research methods and research ethics, see Jones et al., 2018.

Additional details on the Jordanian context are available in the GAGE Jordan Baseline Report (Jones et al, 2019).

2.3 Survey Administration

Once sampling lists were created from the various data sources discussed above, the Mindset office team contacted potential interviewees to set up interviews, calling each household up to five times if the callers were unavailable at earlier calls. A set of replacement households was also listed on the Sampling Sheet, in the order to be used for replacement. Any unreachable households were replaced using the sampling sheet, selecting a household with an adolescent of the same age cohort (young/old), gender (male/female), and location (camp). Additional details on guidelines for survey administration and replacement are available in the Data Collection Field Manual (2021).

2.4 Sample

Ultimately, the GAGE Jordan baseline sample consists of 4,101 adolescents living in Jordan, as well as 4,063 caregivers of adolescents. The sample consists of two cohorts, those age 10-12 and those age 15-17 at the time of the baseline survey (October 2018 through early 2019). Table 1 below provides a brief overview of the final baseline sample; overall, the sample includes 2,114 adolescent girls and 1,987 adolescent boys. As shown in the table, the majority of the sample consists of adolescents living in host communities (2,445, or 59% of the total). An additional 1,348 adolescents (33% of the total) live in formal camps, and a final 308 (8%) live in ITS. Across all locations, the sample includes 412 adolescents with disabilities (10% of the total), as well as 189 adolescents who are currently married or divorced (5% of the total sample).

Additional details on the sample distribution by nationality and more detailed geographic locations is presented in Appendix 2.

Table 1: GAGE Jordan Quantitative Sample by Gender, Age, and Location

	Adult Caregivers	Adolescent girls			Adolescent boys			All Adolescents
Age	Total	10 to 14	15-18	Subtotal	10 to 14	15-18	Subtotal	Total
Location								
Formal camps	1,311	381	302	683	354	311	665	1,348
ITS	305	86	65	151	78	79	157	308
Host communities	2,447	641	639	1280	633	532	1,165	2,445
Subsamples of interest								
Sub-sample of adolescents with disabilities	417	114	95	209	124	79	203	412
Sub-sample of married / divorced adolescents	186	4	182	186	0	3	3	189
Total	4,063	1,108	1,006	2,114	1,065	922	1,987	4,101

2.5 School Questionnaire

In addition to household surveys, the GAGE Jordan baseline data collection also includes a School Questionnaire (Baird et al, 2019). GAGE administered a school questionnaire in the communities of these adolescents to gather additional information about school quality and adolescent access to education, health services, extracurricular activities, and gender norms in local schools. The survey focuses on formal schools where in-school adolescents in the GAGE study were enrolled at the time of the baseline survey. Where schools consented to participate, questionnaires were administered to a key school informant, such as the principal, for that school. Additional information about the administration of the School Questionnaire and how to link schools to their students (CRs) in the GAGE Jordan study, please see the document “GAGE Jordan School Questionnaire Data Use Guide” (2021).

3 Overview of dataset

The GAGE Jordan dataset comprises three data files available through this repository, each in STATA (.dta) format, as listed in Table 2. Note that the “Core Respondent” (CR) is the adolescent respondent. The “Adult Female” (AF) respondent is the adult female caregiver for the adolescent respondent, primarily in charge of care and decision-making for the CR. If there is no primary female caregiver—or if this person was not available or not willing to be surveyed at baseline—the survey may be completed by another household member. In order of availability, alternative respondents for the AF survey if a primary female caregiver is not available are: an adult female in the household who is not the primary decision-maker for the CR; adult male in the household who is a primary decision-maker for the CR; adult male in the household who is not a primary decision-maker for the CR. If no such adults are available, or if the CR lives independently or is married, the CR her or himself may complete the AF survey if she or he is at least 15 years old.

The Adult female (AF) dataset provides a number of variables that contain information on the household, including the household roster, household assets, sources of income, social safety net supports received by the household, and dwelling construction, among other household information. For Primary Female Caregivers of Younger Cohort adolescents (those ages 10-14), the AF survey also collects information about the adolescent, including AF parenting decisions and priorities and adolescent disability and functioning.

In addition, the AF survey contains a number of variables about the AF herself, including health and nutrition, employment and financial resources, and attitudes and perceived social norms around gender roles. For Primary Female Caregivers of Younger Cohort adolescents, additional information is collected about the AF’s life, including access to technology and social inclusion. Among refugee households, the AF survey contains information about displacement and mobility as a result of war.

The Core Respondent (CR) dataset provides data from the survey administered to the adolescent her or himself. This survey contains information reported by the adolescent about her or his life, including education, time allocation, health and nutrition, mental health and resilience, paid work and access to financial resources, social inclusion, relationships and marriage, and experiences with violence, among other topics. The survey also includes the results of education testing, including the ASER Educational Tests in reading and math and Raven’s Progressive Matrices Educational Testing. For Older Cohort adolescents, additional information is collected on adolescent disabilities and functioning, risky behaviours surrounding substance use and peer pressure, and more detailed questions on marriage and sexual and reproductive health.

The Household data file provides clean, final location variables (described further in Section 3.2 below), as well as finalized variables on CR age and gender and indicators for AF and CR survey completion.

For additional information about the identities of the AF, CR, and Adult Male (AM) where applicable, please refer to the companion GAGE Jordan Baseline Data Collection Field Manual (2021). There are number of identifying variables that are common to the two datasets, which will be discussed in the following subsections.

Table 2: Data files

Dataset	Codebook File Name	Description of File
Core Respondent (CR) data	GAGE_Jordan_CR_PUBLICv1.dta	This file contains survey responses provided by the adolescent Core Respondent.
Adult Female (AF) data	GAGE_Jordan_AF_PUBLICv1.dta	This file contains survey responses provided by the Primary Female Caregiver (PFC) of the adolescent Core Respondent. If the PFC is not available, or there is no PFC in the household, this survey may be completed by adult household member or, in some cases, the Core Respondent him or herself if she or he is age 15 or older.
Household data	GAGE_Jordan_HH_PUBLICv1.dta	This file contains clean, final location variables for the household. The file also contains clean, final indicators on Core Respondent age and gender.

3.1 Household Identifiers

Households are uniquely identified by the variable **hhid**. This 9-digit variable allows the user to link the AF, CR, and Household datasets using the merge command. The household identifiers contain information related to the location of the household (governorate and district), the cohort and gender of the core respondent, and sample type. **Note that these household ids were created based on location data derived from sampling lists, where location may correspond to Makani Center rather than actual household location.** Therefore, some households may have a household ID number where digits related to governorate and district are inconsistent with their current household location.

3.1.1 Identifiers for Households in Main Quantitative Sample

The structure of the Household IDs for households in the main quantitative sample—and purposely selected respondent households who are also found in the quantitative sampling lists—is as follows:

- Sample type: The first digit will indicate which sample the household comes from, and is also a general location identifier.
 - 1=Camp Makani, 2=ITS Makani, and 3=Host Community Makani, 4=Camp Non-Makani, 5=ITS Non-Makani, 6=Host Community Non-Makani, 7=Host Community Non-Makani.
- Governorate: Digits 2 and 3 will indicate the Governorate (or camp) where the household lives. (In some cases, where the sample was chosen from the Makani participants lists, Governorate and District are specific to the Makani and not the household location.)
 - The official Governorates in Jordan where households were surveyed are coded as follows:
 - Amman (02)
 - Irbid (05)
 - Jerash (06), including Jerash/Gaza Camp
 - Mafrq (10)
 - There are also unique codes for Azraq (13) and Zaatari (14) Refugee camps.
- District: Digits 4 and 5 will indicate the District within the Sample type and Governorate.

- o The 51 official Districts within the 12 Governorates are coded plus there is a unique code for each “Village” in Azraq camp and “District” in Zaatari camp.
- CR group: Digit 6 will indicate the specific CR group for which the household was sampled.
 - o 1=Young Male, 2=Young Female, 3=Old Male, 4=Old Female, 5=Young Disability, 6=Old Disability
- Household number: Digits 7-9 will indicate the unique household number assigned to household.

3.1.2 Identifiers for Purposely Sampled Households

The structure of the Household IDs for purposely sampled households that were *not* also in quantitative sampling lists is as follows:

- These Household IDs begin with the numbers “800000” or “900000”, followed by a three-digit household number, beginning with 001.
- Note that purposely sampled households can be located in any of the 4 governorates in the Main Quantitative sample above (Amman, Irbid, Jerash, and Mafraq) or Zarqa, or in any of the refugee camps included in the sample (Azraq, Zaatari, or Jerash/Gaza Camp).
- Note that approximately 57% of respondents living in Jerash/Gaza Camp have Household IDs beginning with the numbers “800000” or “900000.” This is because additional Core Respondents living in Jerash/Gaza Camp were identified for the quantitative sample using a snowballing method, rather than being from the Main Quantitative Sampling Lists.

3.2 Location Variables & Identifiers

In addition to AF and CR survey files, the GAGE Jordan public data files include a Household file, which includes final location variables. This identifying data can be merged with the AF and CR survey files using the identifying variable “hhid”.

Each household in the GAGE Jordan sample is classified into one of three location categories:

- The loc_Host indicator =1 for households living in Host Communities in Amman, Irbid, Jerash, Mafraq, or Zarqa governorates. This includes Jordanian adolescents, as well as adolescents of other nationalities living outside of refugee camps.
- The loc_ITS indicator =1 for households living in Informal Tented Settlements (ITS) in Amman, Irbid, or Mafraq governorates. In general, these settlements are located in rural areas. Most households in this setting are Syrian refugees. A smaller number of households in this setting are from traditionally migratory communities in Jordan who live in tented settlements.
- The loc_Camp indicator =1 if households living in refugee camps. This includes the formal Syrian refugee camps Azraq and Zaatari, as well as the informal Palestinian refugee camp Jerash, also called Gaza Camp.

3.2.1 Host Community & ITS Variables

The locations of households living in Host Communities and ITS are further identified by governorate using the following binary variables: gov_Amman; gov_Irbid; gov_Jerash; gov_Mafraq; gov_Zarqa. Data on district and village locations are collected in the formal survey but not provided in the public data.

3.2.2 Syrian Refugee Camp and Jerash/Gaza Camp Variables

Households living in camp settings are further identified by camp of residence. Syrian households can be categorized as living in Azraq Camp by the variable “Azraq” or Zaatari Camp by the variable “Zaatari”.

Palestinian households living in Jerash/Gaza Camp are identified by the binary variable “gov_Gaza”. Additional data on location within camps are collected in the formal survey but not provided in the public data.

3.3 Using the data

The GAGE Jordan baseline sample does not contain sample weights. In general, the GAGE team uses the following guidelines when analysing the baseline data:

- **Controlling for age or cohort:** As previously noted, the GAGE Jordan baseline sample includes two age cohorts, with adolescents age 15-18 at baseline in the older cohort and adolescents age 10-14 at baseline in the younger cohort. Based on the question of interest, it may be appropriate to control for age as a continuous variable or for “age cohort” as a binary variable. See the Household data file for the clean, final CR age variables.
- **Controlling for location:** The Jordan sample includes three locations, (Host Communities, Refugee Camps, and Informal Tent Settlement (ITS), identified by three binary variables: loc_Host, loc_Camp, and loc_ITS (see Household data file). Note that location variables change over time by survey round due to household mobility. You may decide at the outset which round location variables you will use as a control based on the question of interest (baseline, COVID R1, COVID R2, etc.).
- **Controlling for nationality + location:** It may be appropriate in some circumstances to control for nationality and nationality + location for Syrian refugees. This would require 6 dummy variables as follows:
 - =1 if Jordanian
 - =1 if Palestinian
 - =1 if Syrian and Host Community
 - =1 if Syrian and Camp
 - =1 if Syrian and ITS
 - =1 if other nationality
- **Standard errors:** Use robust standard errors for the Jordan sample.

4 Data Issues

The below issues were identified in collaboration with Mindset after completion of GAGE Jordan baseline data collection:

- **Demographic Information:**

- o **CR Gender** – During subsequent rounds of data collection, we identified 5 Core Respondents who were incorrectly coded as the opposite gender during baseline data collection. These updates were made to the variable “**cr_female_CLEAN**” in the Household Data File. This results in some incorrect skip patterns for these 5 respondents throughout the baseline survey. This issue affects the following household ids:
 - 113524006 – Male CR
 - 114621011 – Female CR
 - 414671033 – Female CR
 - 900000333 – Female CR
 - 900000866 – Male CR
- o **CR Age** – During subsequent rounds of data collection conducted in 2020 and 2021, we identified 116 Core Respondents with a potentially incorrect age recorded at baseline. To address these inconsistencies in age reported over time, we include the updated variable “**cr_baseline_age_CLEAN**” in the Household Data File, which reports our best estimate of the CR’s baseline age.
 - Ages were carefully reviewed if a Core Respondent reported a younger age than baseline in 2020 or 2021 or if a Core Respondent reported an age more than 3 years older than baseline during data collection in 2020 or 2021. We used the following process to identify the correct age:
 1. After reviewing birth dates, we default to the most-commonly reported birth year across surveys to identify most likely birth year.
 2. Within the most common birth year, we select the most commonly- reported birthdate. If no common dates are reported, we select the most recently-reported birthdate, prioritizing the date provided by the Core Respondent over those reported by the Adult Female Caregiver. The process was sufficient for 96 of the 116 cases.
 3. If no common birth years were reported, we defaulted first to the birthdate that is most consistent with reported age at each survey round. This process was sufficient for 2 cases.
 4. If no common birth years were reported and no birth dates were consistent with reported ages across rounds, we default to the most recently-reported birth date -- which aligns with the most recently-reported age. This process was sufficient for 15 cases.
 5. If a CR had inconsistent age and never reported a birth date at any survey round, we default to most recently-reported age in 2020 or 2021, as available. We then estimate the correct baseline age as “age at most recent survey” minus 2 years. This process was used for the remaining 3 cases.

- Any observations with a corrected age based on data gathered in 2020 or 2021 are identified in the Household Data File in the variable “age_corrected.”

- **Survey Questions**

- o **CR Mobility** – Due to a programming error, the set of questions asked to Core Respondents living in Camp and ITS settings are slightly different than those asked to Core Respondents living in Host Communities for questions 4a and 5a. The question differences are as follows:

- **Question 4a** asks “Who is the MAIN person you would need permission from” to go to the specified location. For respondents living in “Camp” and “ITS” settings, the programmed survey asked a follow-up question about this person: “What is the gender of this person?” This information is not asked for respondents living in host communities. However, we provide this additional information as available under the variable names:

- cr_mva_gender_1 for “local market”
- cr_mva_gender_3 for “the home of a relative, friend, or neighbour”
- cr_mva_gender_4 for “a religious institution (Mosque or Church)”
- cr_mva_gender_5 for “Koranic classes”
- cr_mva_gender_6 for “Cafés”
- cr_mva_gender_7 for “Playground or sports fields”
- cr_mva_gender_8 for “Makani”
- cr_mva_gender_9 for “a place in the community where you feel safe with your friends”

- **Question 5a** asks “Who would typically travel with you” to the specified location. For respondents living in “Host community” settings, the programmed survey used a slightly more detailed set of answer options than those living in “Camp” and “ITS” settings. For ease of analysis, we provide two versions of the variable. First, we provide a combined variable for all relevant respondents that uses the less-detailed set of response options, as follows:

Response options for variable: cr_mva_companion_X	
-96	Other, specify
1	A friend of my age
2	Spouse
3	Mother
4	Father
5	Older brother
6	Married older sister
7	Other household member
8	Other non-household member

This response option is available for all locations asked about in the survey in the following variables:

- cr_mva_companion_1 for “local market”
- cr_mva_companion_2 for “mall”

- cr_mva_companion_3 for “the home of a relative, friend, or neighbour”
 - cr_mva_companion_4 for “a religious institution (Mosque or Church)”
 - cr_mva_companion_5 for “Koranic classes”
 - cr_mva_companion_6 for “Cafés”
 - cr_mva_companion_7 for “Playground or sports fields”
 - cr_mva_companion_8 for “Makani”
 - cr_mva_companion_9 for “a place in the community where you feel safe with your friends”
- Second, we provide a separate variable with more detailed response options for those respondents living in host communities only. The response options for that more detailed variable are as follows:

Response options for variable: cr_mva_companion_host_X	
-96	Other, specify
1	A female friend of my age
2	A male friend of my age
3	Spouse
4	Mother
5	Father
6	Older brother
7	Married older sister
8	Other household member, female
9	Other household member, male
10	Other non-household member, female
11	Other non-household member, male

This version of the variable with response options listed above is available for all locations asked about in the survey—for those respondents living in host communities only—in the following variables:

- cr_mva_companion_host_1 for “local market”
- cr_mva_companion_host_2 for “mall”
- cr_mva_companion_host_3 for “the home of a relative, friend, or neighbour”
- cr_mva_companion_host_4 for “a religious institution (Mosque or Church)”
- cr_mva_companion_host_5 for “Koranic classes”
- cr_mva_companion_host_6 for “Cafés”
- cr_mva_companion_host_7 for “Playground or sports fields”
- cr_mva_companion_host_8 for “Makani”
- cr_mva_companion_host_9 for “a place in the community where you feel safe with your friends”

o **AF Survey – Family Background Section**

- This section of the survey asks a series of questions about the Core Respondent's natural (biological) mother and father. These questions are only asked if the Core Respondent's natural mother and father do **not** live in the household and are not included in the Household Roster section. Question 5 asks about the highest level of education the Core Respondent's father attended. Question 11 asks the same of the Core Respondent's mother. For each of these questions, a small number of respondents indicated that the father or mother is illiterate or has never attended formal education under "Other, specify" (this was not an answer option for the question as programmed in the survey). Accordingly, we created an additional indicator for Question 5 and Question 11 to identify those responses indicating that the Core Respondent's father and/or mother never attended formal education. These variables are described as follows:
 - af_fb_fhighedu_none: =1 if CR's biological father (outside of household) has no formal education
 - af_mb_fhighedu_none: =1 if CR's biological mother (outside of household) has no formal education

o **AF Survey – Safety Nets**

- This section of the AF Survey asks a series of questions around various social safety net programs, including the Hajati cash transfer program, which targets school-age children. In Question 7, the survey asks about which household members benefit directly from each of the social safety net programs. For these questions, subsequent checks of the data show some logical inconsistencies in which household members are listed as benefiting directly from each program. For example, some AF Respondents stated that household members who are older adults, rather than school-aged children, benefited directly from the Hajati program. Note that we present the responses to these questions as provided by the respondent, and we did not make any changes to the responses based on whether or not a household member has the necessary characteristics to be eligible for a given social safety net program.

o **AF Survey – Refugee Status**

- This section asks a series of questions to Adult Female respondents who are refugees in Jordan. Although respondents identify a home country other than Jordan, a small percentage of the refugee sample reported, using the "Other, specify" answer option to Question 8 (When you arrived in Jordan, who came with you?), that they were born in Jordan. To identify these households, we created an additional indicator for Question 8 to identify the 95 households of a refugee nationality where the Adult Female respondent was born in Jordan. The variable is described as follows:
 - af_ref_borninjordan: =1 if AF reports that she (or he) was born in Jordan

5 Data Codebook

Codebooks for each of the raw datasets are included in separate pdf documents in the depository. Please refer to the files listed in Table 3 for the respective codebooks. The survey module documents can also serve as a useful tool to understand the data. All variables are organized according to their order in the original survey for ease of reference.

Table 3: Codebooks for the raw data

Dataset	Codebook File Name
Core Respondent (CR) data	GAGE_Jordan_CR_Codebook_complete.docx
Adult Female (AF) data	GAGE_Jordan_AF_Codebook_complete.docx

Appendix 1: Makani Programme Overview

The motto of UNICEF Jordan's flagship integrated child, adolescent and youth Makani programme is: 'I am safe, I learn, I connect.' However, while the fundamental goals of the programme have not shifted, programme components have seen considerable evolution since its 2015 launch. Makani programming was originally delivered by more than a dozen non-governmental and community-based partners and combined alternative education with life skills training, child protection and psychosocial support. It aimed to support refugee children (primarily Syrian) by connecting them with peers and trusted adults in safe spaces and to facilitate the development of their voices and confidence as they learned. It also aimed to provide services for parents, to strengthen communities and to ensure that children in need of specialist services were identified and referred. In recent years, as Jordan's double-shift school system has expanded (with UNICEF's support) and more Syrian children have gained access to formal education, the Makani programme has adjusted its approach (see Figure 2 below).

One notable difference in more recent programming – which is now delivered directly by UNICEF in UNHCR camps – is that in host communities it now specifically targets groups of children beyond Syrians, including both vulnerable Jordanians and Palestinians. This is partly to ensure that other groups of young people have equitable access to services, and partly to foster social cohesion between different groups. Another key difference is that in most locations, Makani centres are now actively working to ensure that children are enrolled in formal education and are providing after- (or before-) school learning support rather than stand-alone informal education. Life-skills sessions, which continue to focus on confidence and communication, are available to young people aged 10–24 and are now also sometimes accompanied by Social Innovation Labs, which aim to attract and retain older adolescents (those aged 14–18) by providing them with enhanced opportunities to learn the skills (hard and soft) that could improve their own futures and those of their communities. Psychosocial support has been effectively rebranded child protection and, as well as helping children process the conflict-related violence they may have experienced or witnessed, is offering formal sessions that help children understand – and access – their right to live a life free from all types of violence. Finally, Makani's stepped-up outreach approach includes an increasing number of community committees and sessions for parents, as well as (in some centres) early childhood education. In 2018, the Makani programme reached more than 200,000 people, including more than 160,000 children, through 150 centres.² Note that this description of the Makani program is drawn from *Adolescent well-being in Jordan: exploring gendered capabilities, contexts and change strategies*, A synthesis report on GAGE Jordan baseline findings (Jones et al, 2019).
